

Abstract:**MARKING DEVICE**

A marking device (10) comprises a housing (12)
5 having a handle (16). A frame (20) is pivotally mounted
in the housing about a first axis (22). A marking head
(40) mounted on the frame for translational movement in
the frame by a first motor (84) in a first direction (x)
parallel said first axis and spaced therefrom. A second
10 motor (100) is arranged to pivot the frame with respect
to the housing about said first axis in a second,
substantially orthogonal direction (y). The pin moves in
a third orthogonal direction (z). The motors (84,100)
are disposed within the confines of the frame (20) and
15 move on fixed screws (84,104).
